NIRSS

# WFIRST Scientific Objectives

The full distribution of planets around stars

**National Academy of Sciences**  
Astronomy & Astrophysics  
Decadal Survey (2010)

- WFIRST uses— **AFTA** (Astrophysics Focused Telescope Asset)
- AFTA is a repurposed **2.4 m** telescope from the US National Reconnaissance office (NRO)
- The AFTA telescope is already built, and sitting in a storage facility

- WFIRST-AFTA includes a coronagraph to image exoplanets
- This was not envisaged by the decadal survey
- Enabled by the 2.4 meter mirror

# WFIRST Science

## Wide Field Channel

- Very large imaging field of view (FOV) ( $0.8^\circ \times 0.4^\circ$ )
- High spatial resolution (0.11 arcsec/pixel)
  - Stable image quality (1.0 nm RMS wave front error variation in 180 sec)
  - 7 imaging filters spanning visible & NIR: 0.48 to  $2.0\mu\text{m}$
  - grism for multi-object, low-resolution spectroscopy

HST/ACS

HST/WFC3

JWST/NIRCAM

# Integral Field Spectrograph

- Supernova FOV: 3 x 3 arcsec, 0.075 arcsec/pixel resolution
- Photo-z Calibration FOV 6 x 6 arcsec, 0.15"/pixel resolution
- Very high sensitivity, NIR pass band (0.45-2.0 $\mu$ m)
- Low spectral resolving power (70-140  $\lambda/\Delta\lambda$ )

# WFIRST Surveys

- Multiple surveys:
  - High-Latitude Survey
    - Imaging, spectroscopy, supernova monitoring
  - Repeated Observations of Bulge Fields for microlensing
  - 25% Guest Observer Program
  - Coronagraph Observations
- Flexibility to choose optimal approach

# Nominal Capabilities\*

## WFI:

Imager      **0.76-2.0 microns**   0.28° FoV, 0.11" pixel scale      **Photo-z**

Filters: R(0.48-0.76), Z (0.76 - 0.98), Y (0.93-1.19), J (1.13-1.45), H(1.38-1.77), F184 (1.68-2.0), W149 (0.93-2.00)

**Shapes**

Grism:      **0.95-1.9 microns**   0.28° FoV, R=461λ, 0.11" pixel scale

IFC:      **0.6-2.0 microns**      3" & 6" FoV, R~100, 0.075" pixel scale

## Coronagraph:

Imager:      **0.43-0.97 microns**   1.63" FoV (radius), 0.01" pixel scale, 1k x 1k EMCCD, 10<sup>-9</sup> final contrast, 100-200 mas inner working angle

IFS:      **0.60-0.97 microns**   0.82" FoV (radius), R~70

**Field of Regard:**   54° - 126°      60% of sky available at any given time

\*filters and exact wavelength ranges are still being optimized

# The Universe as a Pie Chart

# Top level questions

---

- 1. Is cosmic acceleration caused by a new energy component or by the breakdown of General Relativity (GR) on cosmological scales?**
- 2. If the cause is a new energy component, is its energy density constant in space and time, or has it evolved over the history of the universe?**

# Consequences of DE

Dark Energy affects the:

- **Expansion history** of the Universe
  - How fast did the Universe expand?
  - Also called the **geometry** of the Universe
- **Growth of structures**
  - How do structures (which are mostly dark matter) evolve and grow over time
  - Attractive gravity competes with repulsive dark energy

If Einstein's General Relativity is wrong, **modified gravity theories** could explain the accelerating expansion.

This would change the above effects differently, *so we must measure them both!*

# Probes of DE

Comparison of expansion history and growth of structure helps distinguish **dark energy** and **modified gravity** models

- **Supernovae type IA**, which act as standard candles to measure the expansion history
- **Weak gravitational lensing**, the apparent distortion of galaxy shapes by foreground dark matter
  - Measures primarily growth of structure
- **Galaxy clustering**
  - Baryon acoustic oscillations (**BAO**), which act as a standard ruler to measure the expansion history
  - Redshift space distortions (**RSD**) which measure the growth of structure

Dark energy studies are done **statistically**, and require great precision and attention to **systematics**

**Wide field** **space** mission is required

A diagram consisting of two arrows. A red arrow points downwards from the word "statistically" in the line above to the word "Wide" in the line below. A green arrow points diagonally down and to the left from the word "systematics" in the line above to the word "space" in the line below.

# WFIRST Dark Energy Roadmap

## Supernova Survey

wide, medium, & deep imaging  
+  
IFU spectroscopy  
—  
2700 type Ia supernovae  
 $z = 0.1\text{--}1.7$

standard candle distances  
 $z < 1$  to 0.20% and  $z > 1$  to 0.34%

## High Latitude Survey

spectroscopic: galaxy redshifts  
16 million H $\alpha$  galaxies,  $z = 1\text{--}2$   
1.4 million [OIII] galaxies,  $z = 2\text{--}3$

imaging: weak lensing shapes  
380 million lensed galaxies  
40,000 massive clusters

### standard ruler

distances	expansion rate
$z = 1\text{--}2$ to 0.5%	$z = 1\text{--}2$ to 0.9%
$z = 2\text{--}3$ to 1.3%	$z = 2\text{--}3$ to 2.1%

### dark matter clustering

$z < 1$  to 0.21% (WL); 0.24% (CL)  
 $z > 1$  to 0.78% (WL); 0.88% (CL)  
1.1% (RSD)

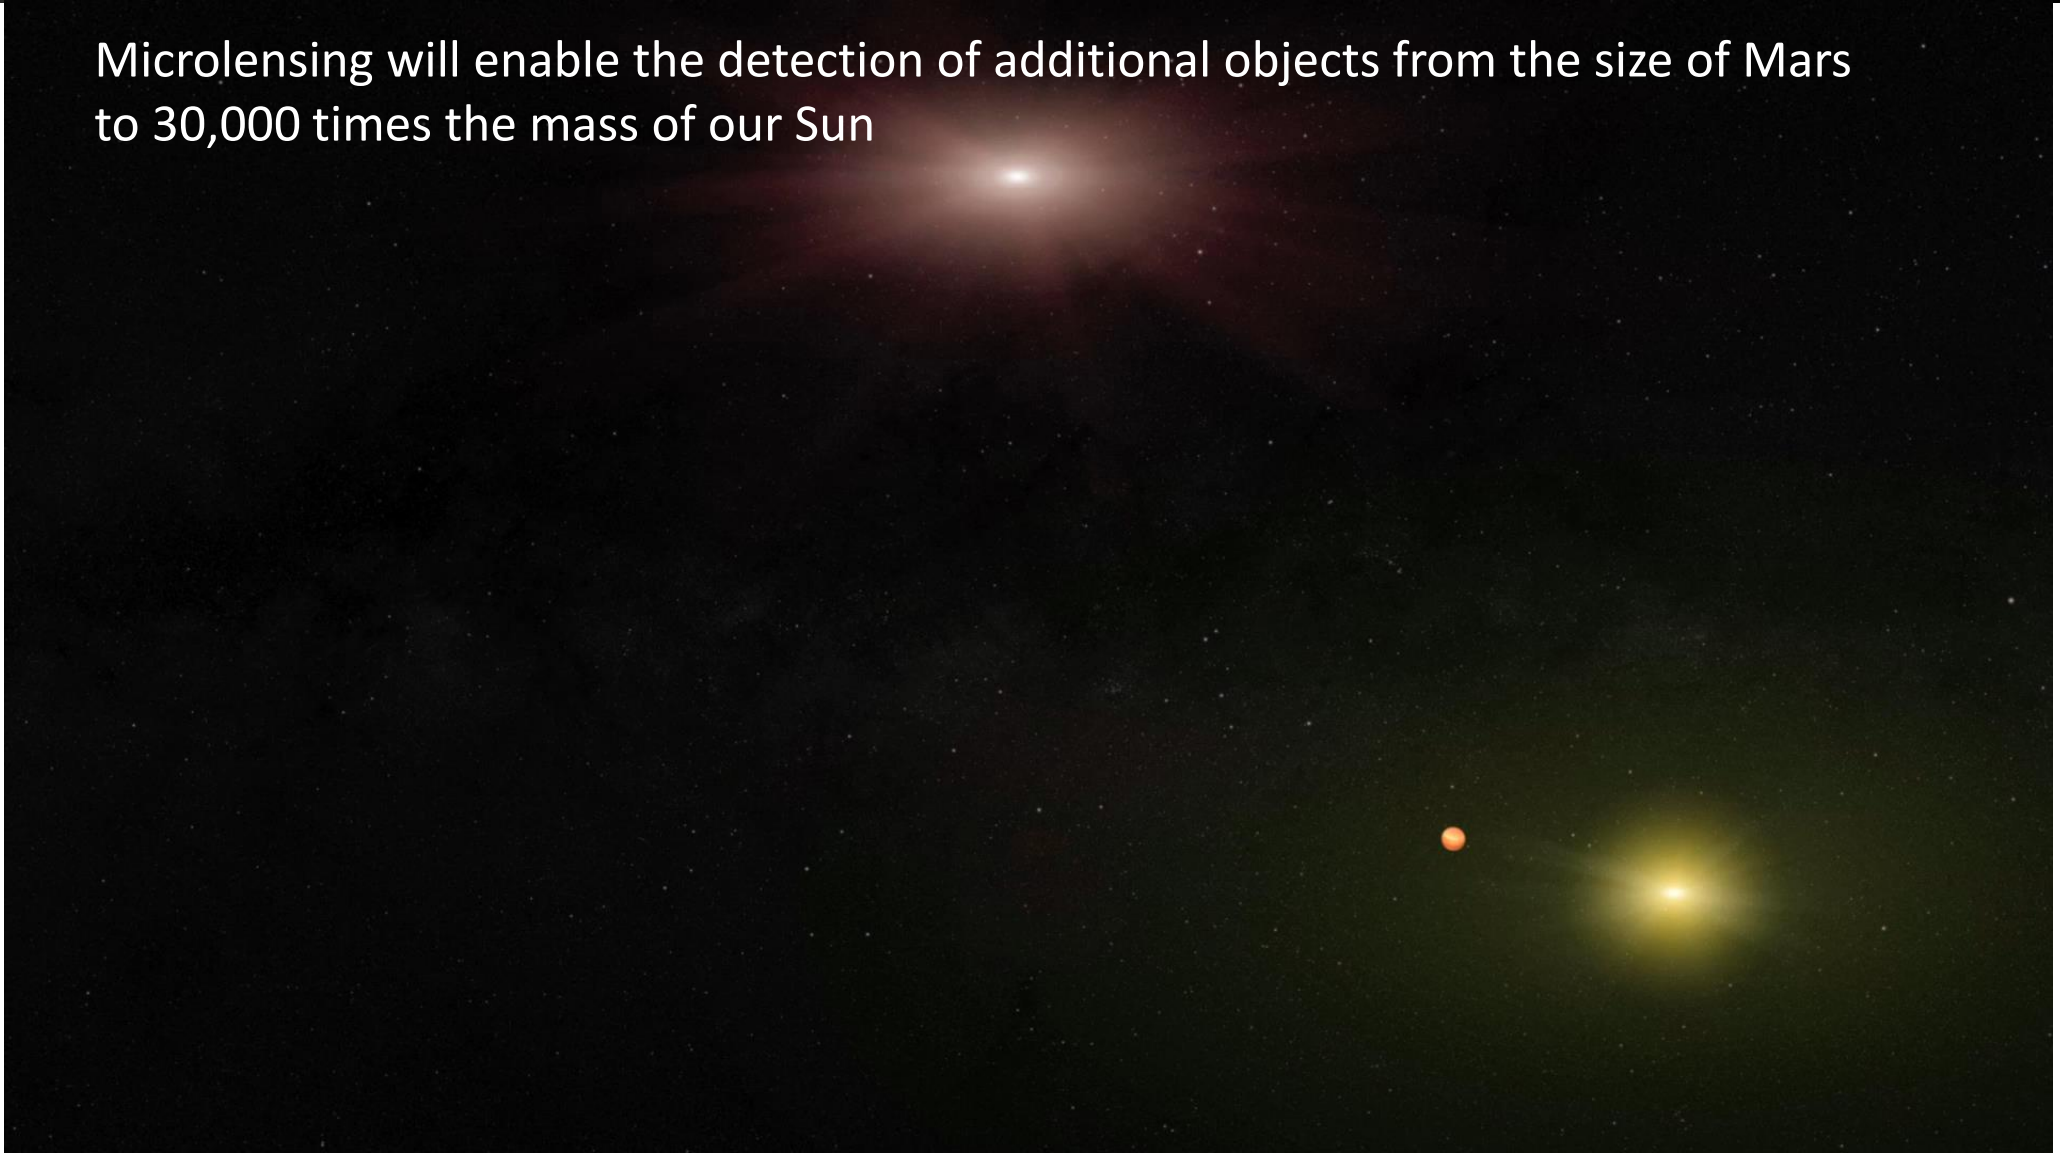

history of dark energy  
+  
deviations from GR

$w(z)$ ,  $\Delta G(z)$ ,  $\Phi_{\text{REL}}/\Phi_{\text{NREL}}$

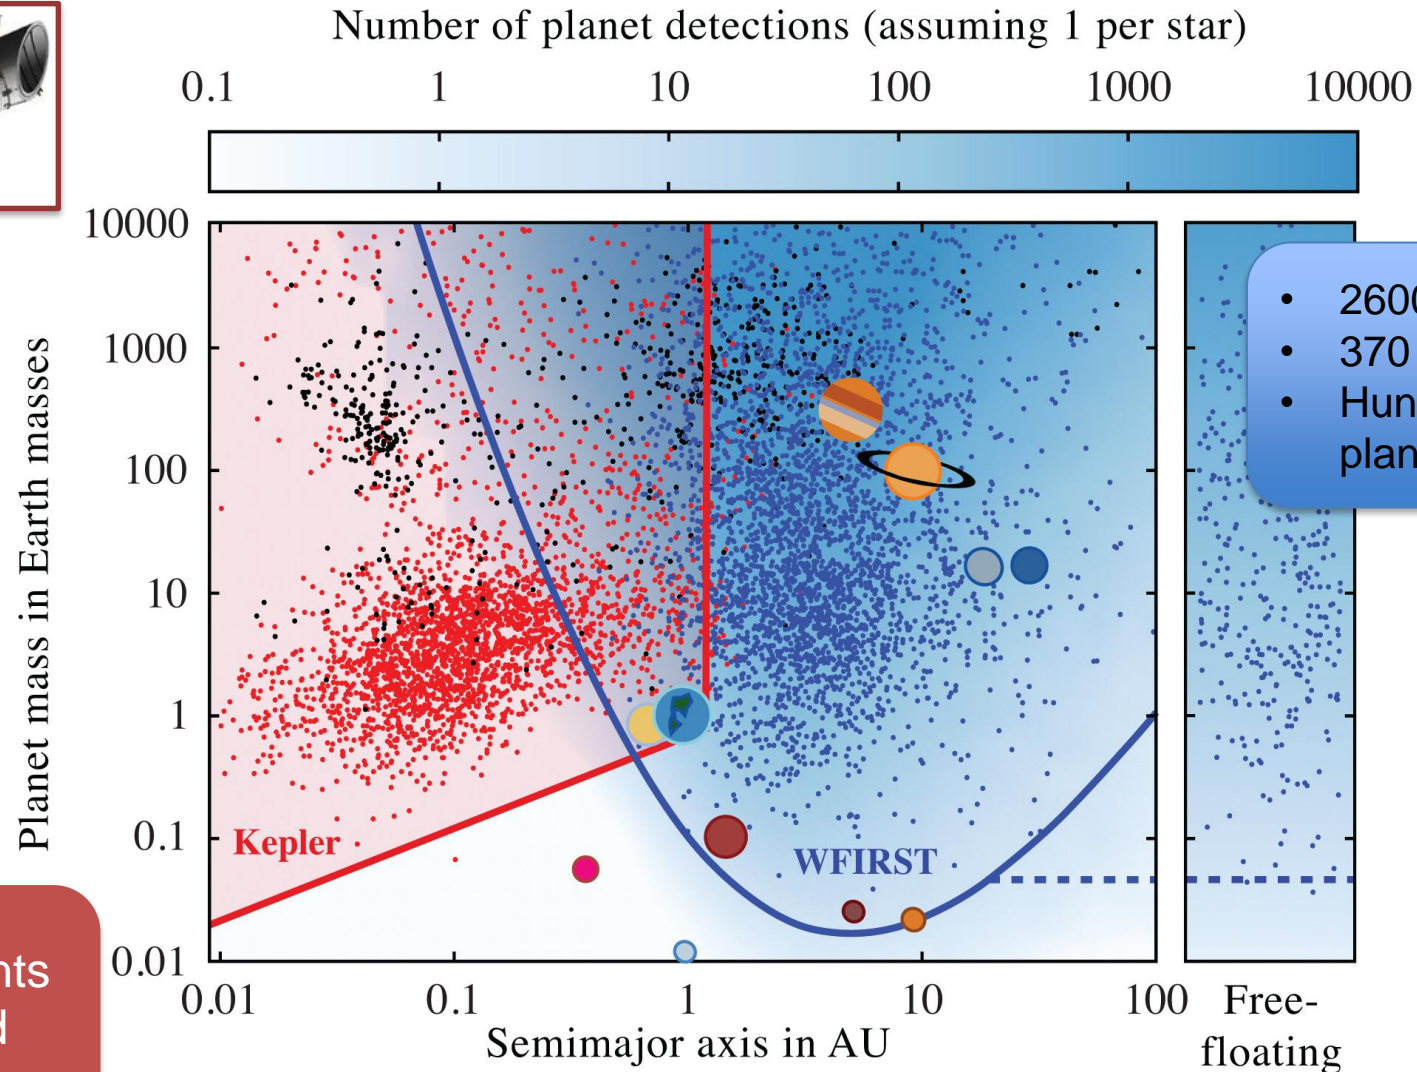

Microlensing will enable the detection of additional objects from the size of Mars to 30,000 times the mass of our Sun

# Exoplanet Surveys Kepler & WFIRST

- 2600 planet detections.
- 370 with Earth mass and below.
- Hundreds of free-floating planets.

WFIRST complements  
Kepler, TESS, and  
PLATO.

# WFIRST Complements Kepler

# Coronagraphy

- A coronagraph ‘blocks’ light from a host star, enabling light from an exoplanet to enter the detector
- The contrast between a host star and the planets is large

# Coronagraphy

# Coronagraphy is Challenging

- Current best coronagraphs reach a contrast ratio of  $10^{6-7}$
- WFIRST requirements are for  $10^9$
- All technological milestones have been hit ahead of schedule and  $10^8$  has been shown in lab
- WFIRST will test two different types of coronagraphs for both spectroscopy (shaped pupil) and photometry (hybrid Lyot)
- What we need for direct imaging of an exo-Earth to show biomarkers is probably  $10^{10}$
- The Astro 2020 Decadal Survey will look at HabEx and LUVOIR, two mission concepts that might be able to do this

# Coronagraph Performance

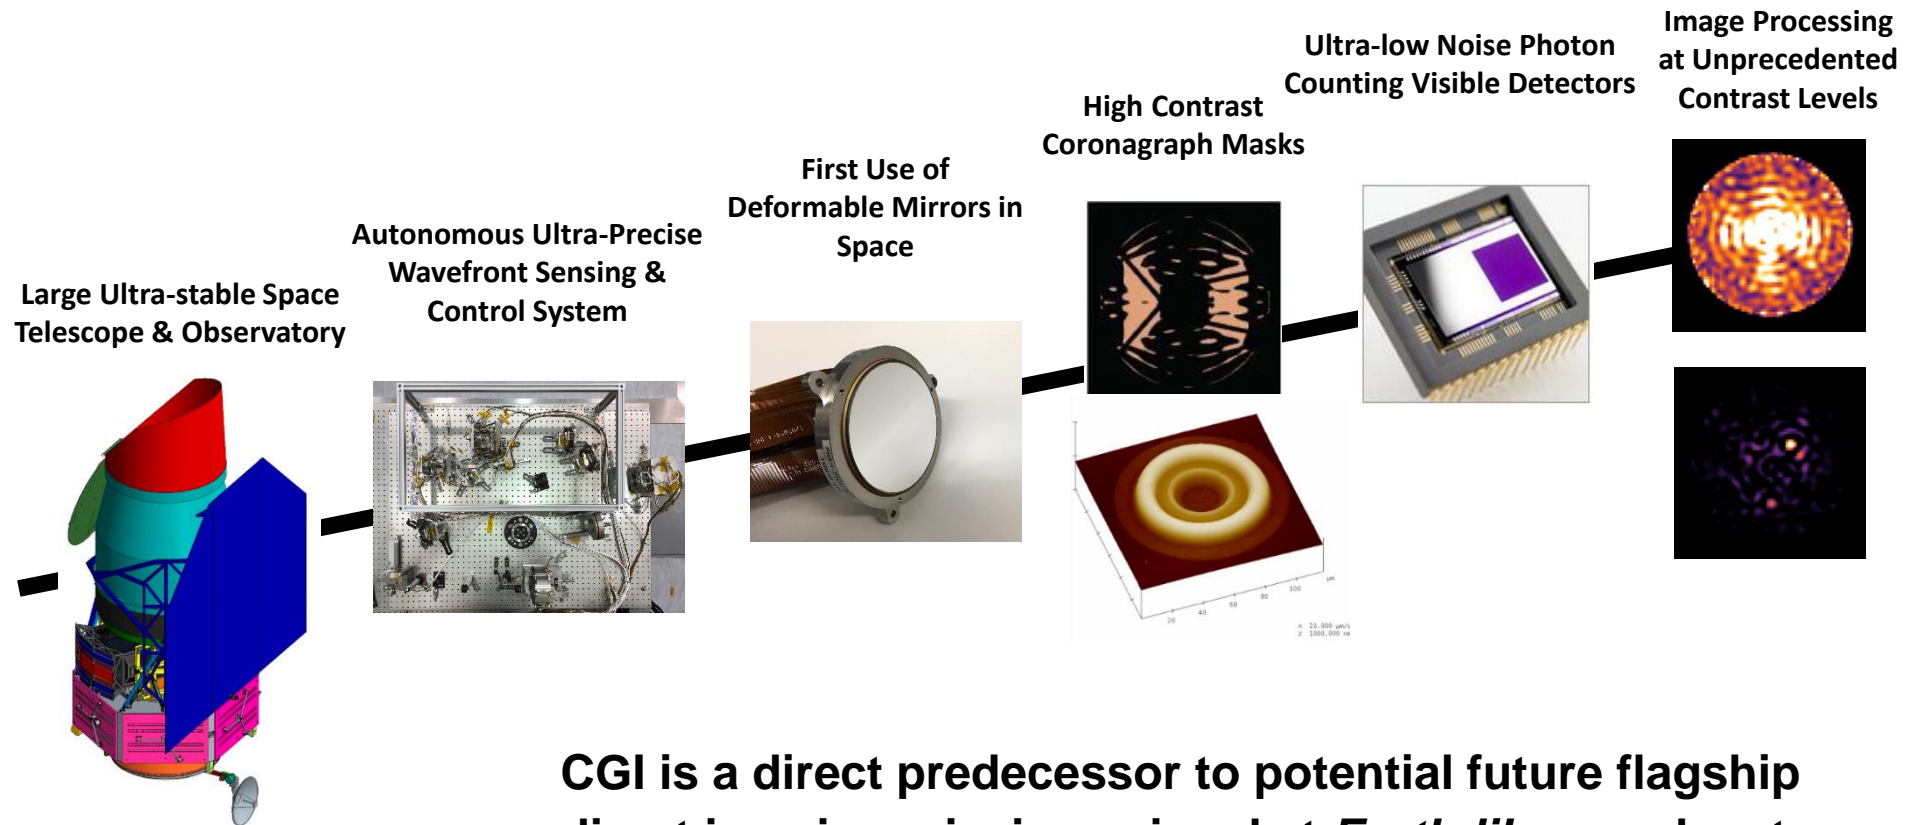

# WFIRST CGI Science Yield vs Instrument Performance: Exo-planetary systems

- With  $\sim 3 \times 10^{-9}$  contrast at 0.2'', WFIRST CGI will:
  - Get first optical images of  $\sim 10$  known RV EGPs orbiting mature sun-like stars
  - Get first reflected (albedo) spectra of a few of them
  - Image faint debris disks structures down to a level of  $\sim 40$  times that of our solar system's zodiacal dust, in and exterior to the HZ
  - Get first optical images and optical spectra of known young EGPs, constraining their metallicity, formation process, and mass
- With  $10^{-8}$  contrast at 0.2'', WFIRST CGI will:
  - Possibly get first optical images of a few known giant RV planets orbiting mature sun-like stars
  - Image faint debris disks structures down to a level of  $\sim 100$  times that of our solar system's zodiacal dust, in and exterior to the HZ
  - Get first optical images and first optical spectra of known young giant exoplanets, providing information about temperature and physical properties

Science \ Contrast	$10^{-9}$	$3 \times 10^{-9}$	$10^{-8}$	$10^{-7}$
Cool EGPs optical spectra	Yes (10+)	A few	No	No
Cool EGPs optical Images	Yes	Yes	Possibly	No
Young EGPs optical spectra	Yes	Yes	Yes	Some
Young EGPs optical images	Yes	Yes	Yes	Some
Exo-Zodi Disks optical images	10 zodis	40 zodis	$\sim 100$ zodis	1000 zodis

Table from B. Mennesson

# Coronagraph technology development

**CGI is a direct predecessor to potential future flagship direct imaging missions aimed at *Earth-like* exoplanets (HabEx and LUVOIR)**

# Starshade

# Starshade at JPL

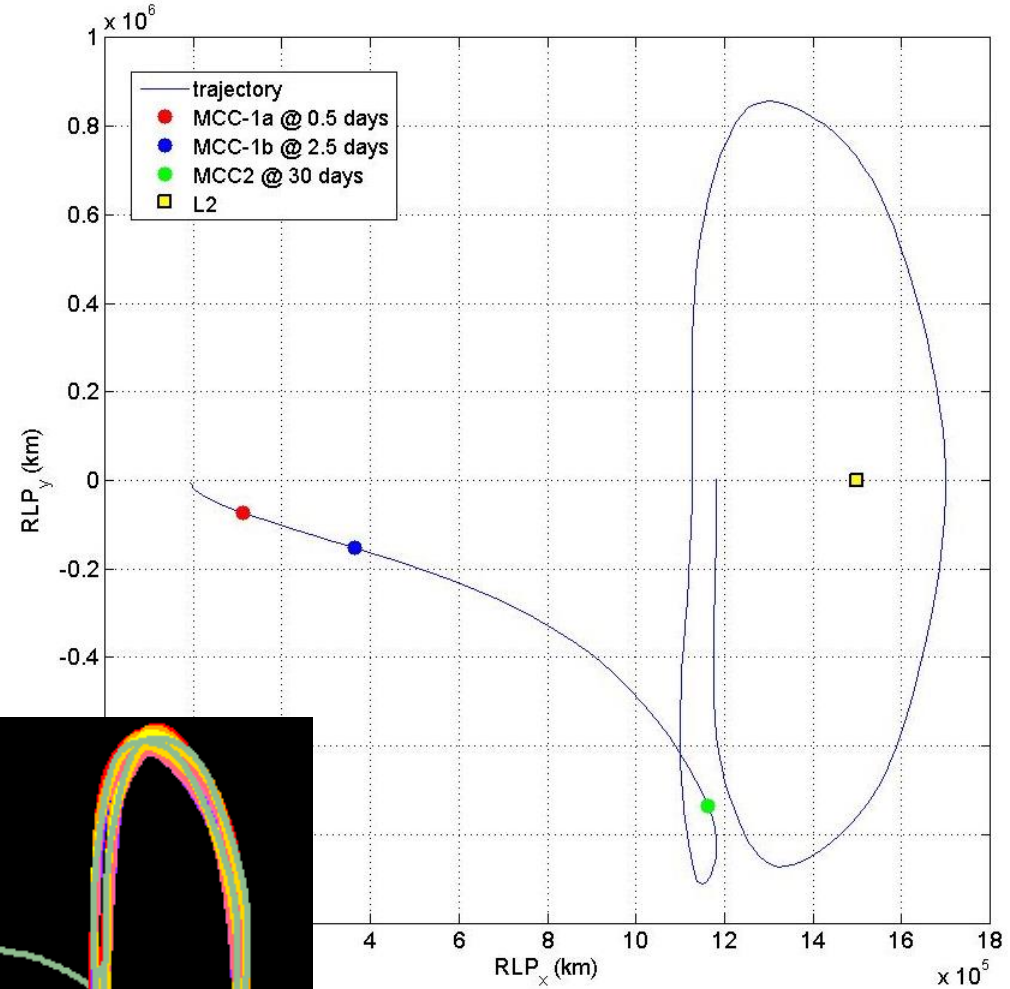

- High Latitude Survey - ~2000 sq deg
  - Imaging: Y, J, H, F184 to AB ~26.5 ( $5\sigma$  point src)
  - Slitless spectroscopy:  $1.e-16$  ergs/cm<sup>2</sup>/s
- Supernovae
  - Imaging & IFC spectroscopy (6 months)
- Microlensing
  - Six Galactic Bulge seasons
- Coronagraphy
  - Technology demonstration, plus ???
- GO
  - 1.25 years – the sky is the limit!
- *This is just one DRM example of how the WFIRST Science Campaigns could be conducted*
- *Notional durations obtained using first-order, simplistic models*
  - Serial execution of all science campaigns
  - Using the baseline science requirements (BSRs)
- *Updates to higher-fidelity models in-progress to refine notional duration estimates*
  - Affords opportunities to explore science scheduling efficiencies and parallel (WFI & CGI) science observations
  - Uses candidate science targets, proper orbital geometries and science campaign characteristics

# Planned Sun-Earth L2 halo orbit

Diameter of  
planned halo  
orbit is  
comparable to  
Earth-L2  
distance

# Mission Design Elements

## *Field of Regard*

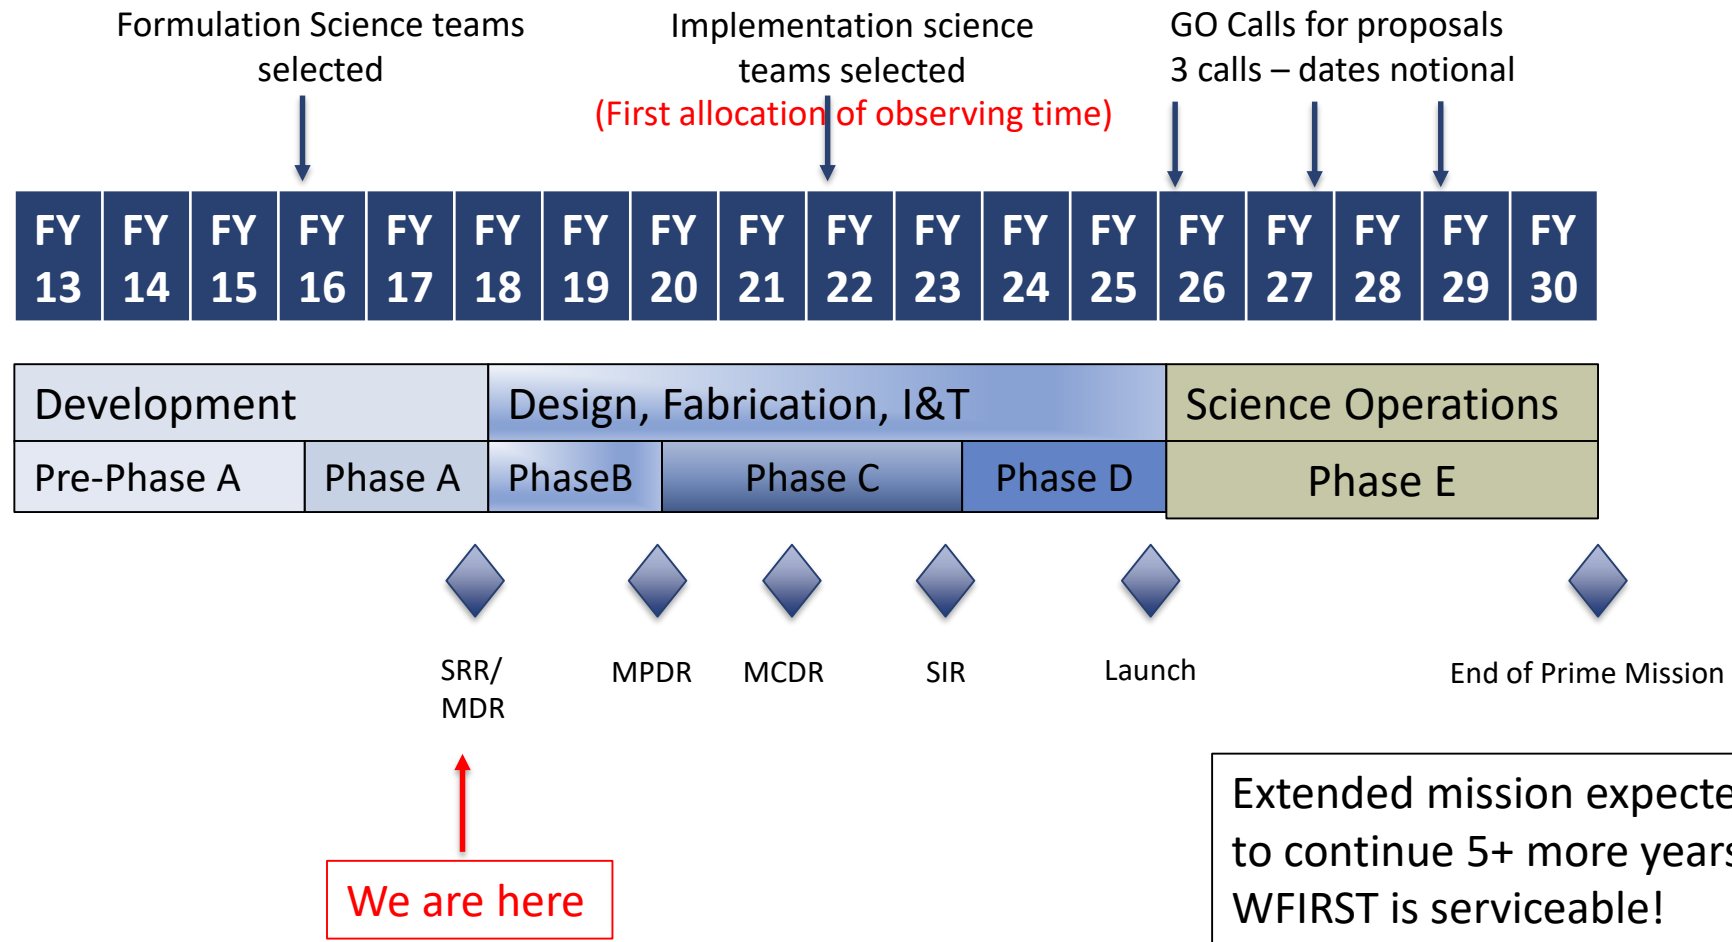

## Field Of Regard (FOR)

- Based on Science Needs
- Considers launch vehicle constraints, power and thermal performance
- Figure below incorporates the solar exclusion zone and ACS margin zone
- **No changes anticipated**

# Project Schedule

# Opportunities with WFIRST

---

- 25% Guest Observer in 5 year prime mission
- ~100% GO in extended mission
- Guest Investigator calls throughout mission
- All prime survey science teams will be competed in ~2021
- 2020 Decadal Survey will consider a Probe class Starshade

Wide	W146	0.927	2.000	1.464	1.030	1.42
GRS	G150	0.95*	1.90*	1.445	0.890	461 $\lambda$ (2pix)

\* Grism bandpass is adjustable, up to  $\lambda_{\text{max}} \leq 2 \times \lambda_{\text{min}}$

# WFIRST Instruments

## Wide-Field Instrument

- *Imaging & spectroscopy over 1000s of sq. deg.*
- *Monitoring of SN and microlensing fields*
- 0.5 – 2.0  $\mu\text{m}$  (imaging) & 1.0-1.9  $\mu\text{m}$  (grism)
- 0.28  $\text{deg}^2$  FoV (100x JWST FoV)
- 18 H4RG detectors (288 Mpixels)
- 7 filter imaging, grism + IFU spectroscopy

## Coronagraph

- *Image and spectra of exoplanets from super-Earths to giants*
- *Images of debris disks*
- 430 – 970 nm (imaging) & 600 – 970 nm (spec.)
  - *Under revision: tech demo configuration TBD*
- Final contrast of  $10^{-9}$  or better
- Exoplanet images from 0.1 to 1.0 arcsec

# WFIRST will

measure galaxy shapes to map dark matter and measure the growth of galaxies over the Universe's life

# WFIRST will

map the positions of galaxies to establish a cosmic standard ruler to measure the Universe's expansion history

# WFIRST will

discover exploding stars (supernovae) across cosmic time  
to establish precise distances to galaxies

Table 2.

Field <sup>a</sup>	R.A.	Dec.	Ecl. Lat.	Area	E(B-V)	Zodi <sup>b</sup>	Days/Year	No. of Spectra <sup>c</sup>
